

Phase 1: Brainstorming & Ideation

1.1 Problem Statement

Drafting a legal document (employment contract, NDA, lease) usually means hiring a lawyer or copying generic templates that do not fit the situation. Startups, freelancers, landlords and individuals face high cost, long turnaround and legal jargon they cannot verify. Generic templates are not tailored to the parties, dates and terms involved.

Problem in one line: *People without a legal background need a fast, affordable way to produce a well-structured, customized, editable legal document.*

1.2 Target Users

User	Need	Example (from project scenarios)
Startup founder	Employment contract with roles, compensation, confidentiality; branded output	Scenario 1: new hire contract downloaded as a branded PDF
Freelancer	Quick NDA / service contract before starting work with a client	Scenario 2: NDA with parties, confidentiality scope, effective date

Landlord / property manager	Residential lease with editable sections, Word format	Scenario 3: lease agreement as .DOCX
Individuals / small businesses	Simple agreements without legal knowledge	Offer letters, service agreements

1.3 Empathy Map (Primary User: Freelancer / Founder)

Says	Thinks	Does	Feels
"Lawyers are expensive for a simple NDA."	"Will a template actually cover my case?"	Searches for templates online, edits in Word	Anxious about missing clauses
"I need this by tomorrow."	"I don't understand this legal wording."	Copy-pastes clauses from different sources	Frustrated by inconsistent formatting

1.4 Ideas Brainstormed

#	Idea	Notes
1	Template library with fill-in-the-blank fields	Simple, but rigid; cannot adapt clauses to custom terms
2	AI-generated documents from structured inputs (parties, terms, dates)	Flexible, fast, customizable, low cost

3	Contract analysis / plain-language summary of uploaded documents	Valuable, but a different problem; kept as future scope
4	Multilingual document generation	Nice to have; future scope
5	Lawyer marketplace	Out of scope

1.5 Idea Prioritization (Impact vs Effort)

Idea	Impact	Effort	Decision
AI generation from structured inputs	High	Medium	Selected (MVP)
Editable preview + multi-format export	High	Medium	Selected (MVP)
Branding (logo, fonts, footer)	Medium	Low	Selected (MVP)
Contract analysis / summaries	High	High	Future scope
Multilingual support	Medium	Medium	Future scope
Template library	Medium	Low	Not selected (replaced by AI generation)

1.6 Proposed Solution

A web application where the user:

1. Enters **document type, parties, terms (semicolon-separated) and effective date** in a Streamlit form.
2. Clicks **Generate Document**; a FastAPI backend builds a structured prompt and calls **Gemini** to draft the document.
3. Sees a styled preview, optionally **edits** the text, and

4. **Downloads** it as **.txt**, **.docx** (with logo, Times New Roman, terms table, footer) or **.pdf** (branded header/footer).

1.7 Unique Value Proposition

- Tailored to user inputs rather than generic templates
- Editable before export, so the user stays in control
- Professional, branded output in three formats
- No legal background required
- Secure handling of API keys via `.env`

1.8 Scope

In scope (MVP)	Out of scope (future)
Generate legal documents from 4 inputs	Contract analysis / summarization of uploaded files
Editable text preview	User accounts and saved document history
Export to TXT, DOCX, PDF	E-signature
Logo, fonts, footer branding	Multilingual output
Local deployment (FastAPI + Streamlit)	Cloud deployment, legal database integration

1.9 Success Criteria

- A user can go from empty form to downloaded document in under 2 minutes
- All three export formats open correctly and contain the user's inputs
- Generated documents contain structured sections (parties, terms,

- governing law, signatures)
- App handles invalid input and API failures with clear messages

1.10 Assumptions and Ethical Considerations

- Output is a **draft**, not legal advice; the UI and exports should carry a disclaimer
- Users should not enter highly sensitive personal data unnecessarily; no user data is stored by the app
- Legal requirements differ by jurisdiction; users must verify governing-law clauses
